Research Vision

My long-term research vision is to build socially aware AI companions that can perceive actions, perform logical reasoning, and generate realistic reactions in social situations that are enriched with conversations and interactions. This research vision builds on the following technical challenges that are central to my research passion,

- **Multimodal Learning:** learning multimodal representations, grounding, fusion and alignment for perception.
- **Social Intelligence:** reasoning in perceived social situations to set short and long term goals for real or virtual environments.
- **Computer Animation:** generative modeling, reinforcement learning, low-resource and continual learning for planning and executing actions to fulfill goals with applications in human-robot interaction, AR/VR, remote education and collaboration.

PhD Thesis Research

Communication beyond words: Grounding Visual Body Motion with Language

Carnegie Mellon University, Prof. Louis-Philippe Morency

- **Multimodal Grounding:** Constructed a common embedding space for language, acoustics and human body pose for the purposes of co-speech gesture generation.
- **Gesture Style Transfer and Control:** Proposed a many-to-many gesture style transfer set-up and designed efficient approaches to transfer the idiosyncratic gesture styles of one speaker to another speaker.
- **Low-Resource Generative Models:** Designed approaches to generate co-speech gestures for new speakers with significantly lesser supervision.
